**Prepared By:** 

Gabriel Hernandez and Adam Branson

### **Report Highlights:**

Mexico notified the World Organization for Animal Health of its positive findings for porcine epidemic diarrhea virus on May 21, 2014. The disease remains of significant animal health and economic concern but only a limited number of total positive cases were diagnosed in the country while another disease seems to be affecting the pig crop, too. Domestic pork cut prices have been climbing steadily prior to and since the diagnosed outbreak in August 2013.

#### **General Information:**

On May 21, 2014, The National Service of Health, Food Safety, and Food Quality (SENASICA) issued an <u>immediate notification</u> regarding Mexico's positive diagnosis of porcine epidemic diarrhea virus (PEDv), a non-reportable disease, to the World Organization for Animal Health (OIE). The Animal Health Director General, Dr. Joaquin Braulio Delgadillo, reported 83 farms had PEDv outbreaks in 17 out of 19 surveyed states (see red shaded areas in map, below). Two other states (Oaxaca and Yucatan) were sampled for the disease and found negative.

According to SENASICA's information, the surveillance began as a response to a notification of an unusual mortality, mainly in piglets, in the central-western part of the country, with clinical evidence suggestive of porcine epidemic diarrhea virus. The official veterinary services, in coordination with farmers, began investigating the situation, including epidemiological sampling in farrow-to-finish farms, fattening farms, breeding farms, backyard farms and slaughterhouses.

The surveillance activities covered 19 states from August 2013 to May 2014. During the period, 2,309 samples were collected and studied with real-time reverse transcriptase/polymerase chain reaction (RRT-PCR) methodology. SENASICA reported that: "Out of the total number of samples, only 30 percent were positive for PEDv and 70 percent were negative; thereby suggesting that 70 percent of the clinical signs manifested on the farms/in the samples collected are due to some other etiological agent involved in this event."

SENASICA and industry contacts report that, to date, it has not been possible to isolate the virus. Thus, the agency will institute permanent surveillance and continue other biological controls.

FAS comment: Mexico's zoo-sanitary authorities rank this emerging disease with morbidity and mortality rates of three and two, respectively on a scale of 0 to 5. Mexican industry remains concerned with the disease, as it is present in many of the leading pork producing states. In late April 2014, the Confederation of Mexican Pork Producers (CPM) reported that the domestic supply was enough to meet demand. Moreover, according to official Mexican statistics in table 1, below, production in 2014 is outpacing production volumes from 2013 even in some of the states where PEDv has been diagnosed. In addition, CPM reported that the organization and its members had jointly implemented with SENASICA a number of mechanisms to control the spread of PEDv; which they indicate was first detected in Mexico in June 2013. Despite these joint efforts, it appears, according to official statistics and industry sources, that the disease has affected a large geographic area although only present in a few scattered areas.

Table 1. Mexico: Year to Date Pork Production in Metric Tons by State through April 2014
Difference

Rank	State	2014 Forecast	Jan-Apr 2013 YTD	Jan-Apr 2014 YTD	Year Over Year	%age

Red Text indicates that SENASICA reports PEDv has been found in the state.

Chart 1. Mexico: Pork Cut National Average Prices Adjusted from Pesos per Kilogram to U.S. \$ per Kilogram

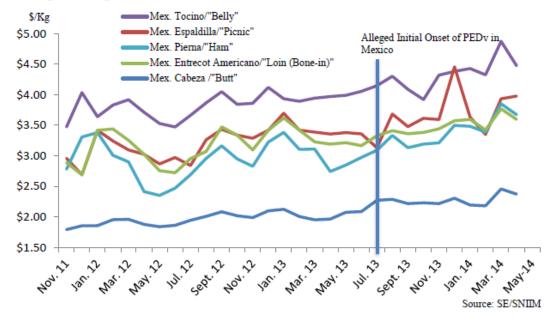

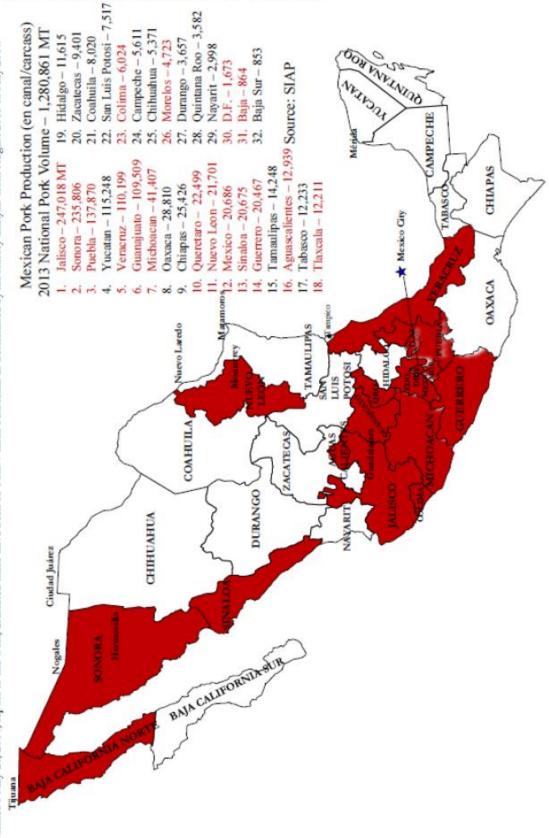

Image 1. Mexico: Map of Confirmed PEDv Outbreaks

Red areas indicate Mexican states where a confirmed (i.e., positive) case of porcine epidemic diarrhea virus (PEDv) was found through SENASICA RRT-PCR analysis Mexico's May 21, 2014, report to the OIE, indicated there have been 83 PEDv farm outbreaks as determined by laboratory analysis from August 2013 to May 2014.

Mexican Pork Production and PEDv Positive Cases
